

Airbnb Clone

Earth-1610 Edition - New Features Report

This project recreates the main Airbnb experience as a web app: searching, filtering, browsing on a map, listing pages, booking, trips, wishlists and hosting. It then adds 15 features that the original Airbnb website does not have. This report lists those features, explains how each one works and where to find it in the app.

Project	Airbnb Clone - Earth-1610 Edition
Type	Educational college project (front-end web application)
Built with	HTML5, CSS3, vanilla JavaScript, Leaflet + OpenStreetMap, Font Awesome
Data storage	Browser localStorage (no server or database needed)
How to run	Open index.html in Chrome, Edge or Firefox (internet needed for photos and maps)
Universe	Earth-1610
Date	09 October 2026

Home page of the clone

Educational use only. Not affiliated with, endorsed by or connected to Airbnb, Inc. All listings, hosts and reviews are made up, and no real payments are processed.

1. New features at a glance

Features that are not on the original Airbnb website. Inside the app they are marked with a pink **NEW** label.

#	Feature	What it does	Where
1	Smart Stay Match	5-question quiz that ranks every stay by match % with reasons.	Home page banner
2	Compare Stays (side by side)	Up to 3 stays in one table with the best value highlighted.	"Compare" tick box on every listing card
3	Price Heatmap Calendar	Calendar coloured by each night's price, from cheap (green) to pricey (red).	Listing page > calendar > "Price heatmap" switch; also when editing dates at checkout
4	Cheapest-Dates Finder	Finds the cheapest available window for your trip length.	Listing page
5	Split the Bill	Split the total equally or by custom amounts and copy payment requests.	Booking card (per-person estimate) and the Confirm and pay page
6	Eco Score and Green Stays	0-100 sustainability score, green badge, category and filter.	Leaf badge on cards
7	Work-from-Stay Score	Wi-Fi speed, desk and quietness combined into one score, plus Wi-Fi filters.	Stay insights panel
8	Neighbourhood Vibe Meter	Ratings for nightlife, quiet, family, nature and food.	Stay insights panel on every listing; also used by Smart Stay Match and Compare
9	Explore Nearby with travel times	Nearby sights and food with distance and walk/drive time.	Listing page > Where you'll be
10	Voice Search	Search by speaking, e.g. "cabins in Manali".	Microphone button inside the Where field of the search bar
11	Smart Packing List	Checklist generated from destination, season and amenities.	Trips page > Packing list
12	Add Trip to Calendar (.ics)	One-click calendar file with a reminder the day before.	Trips page and booking confirmation
13	Travel Rewards: points, tiers and badges	Earn and redeem points, climb tiers, unlock badges.	Profile page
14	Surprise Me	Suggests a random stay from your results or wishlist.	Home page banner and chips
15	Dark Mode	Full dark theme across the site, remembered between visits.	Moon icon in the header

The comparison is with the public Airbnb website at the time of writing. Airbnb's own features may change over time.

2. Feature details

2.1 Smart Stay Match

WHERE TO FIND IT

Home page banner, the Match tab, footer > Clone extras

WHAT IT DOES

A five-question quiz (trip vibe, scenery, who is coming, nightly budget, must-haves) that ranks every listing with a match percentage and shows the reasons it fits, such as "Within budget" or "Fits your couple".

HOW IT WORKS

matchScore() in js/features.js gives each answer a weight (vibe 30, scenery 25, group 15, budget 20, must-haves 10). Vibe uses the listing's tags and its neighbourhood ratings, so results are ranked, not just filtered. Highly rated stays get a small tie-break bonus. The top three matches can be sent straight to Compare.

WHY IT HELPS

Guests who don't have a destination yet get a ranked shortlist instead of scrolling through every listing.

Match results with percentage scores and reasons

2.2 Compare Stays (side by side)

WHERE TO FIND IT

"Compare" tick box on every listing card, Compare button on listing pages, floating compare bar

WHAT IT DOES

Pick up to three stays and see them in one table: price, cleaning fee, estimated 5-night total, rating, space, Eco Score, Wi-Fi speed, work score, vibe and every amenity. The best value in each row is highlighted in green.

HOW IT WORKS

The selected IDs are saved in localStorage, so the selection survives page changes. renderCompare() builds rows from small getter functions and marks the min or max value as "Best".

WHY IT HELPS

Saves opening several browser tabs and memorising prices when you're down to a few options.

 Lago di Braies, Italy Historic boathouse on an emerald alpine lake ViewRemove	 Interlaken, Switzerland Cliff-edge chalet with bed-to-Alps view ViewRemove	 Manali, India Snow-dusted log cabin with a wood fireplace ViewRemove

Bedrooms	1	1	2 ★ Best

Compare table - best values highlighted

2.3 Price Heatmap Calendar

WHERE TO FIND IT

Listing page > calendar > "Price heatmap" switch; also when editing dates at checkout

WHAT IT DOES

Turns the availability calendar into a colour-coded price map. Every available night shows its own price, coloured from green (cheaper) to red (pricier), with booked nights struck through.

HOW IT WORKS

nightlyPrice() models dynamic pricing: a weekend premium, peak and off-season months, and a small deterministic daily variation from a hash function. The DatePicker component scales the colours to the visible months.

WHY IT HELPS

Guests see straight away that moving a trip by a day or two can save money.

Heatmap calendar with the cheapest-window suggestion below it

2.4 Cheapest-Dates Finder

WHERE TO FIND IT

Listing page, under the calendar

WHAT IT DOES

Scans the next 60 days for the cheapest available window that matches your trip length (3 nights by default) and shows the saving compared with peak dates. "Use these dates" fills in the booking card in one click.

HOW IT WORKS

cheapestWindow() slides a window across the next 60 days, skips any window that overlaps a booked night, and keeps the lowest total.

WHY IT HELPS

Budget travellers don't have to check every date combination themselves.

2.5 Split the Bill

WHERE TO FIND IT

Booking card (per-person estimate) and the Confirm and pay page

WHAT IT DOES

Split the trip total between 1-12 people, either equally or by custom amounts. A live check warns if the shares don't add up, and "Copy payment requests" copies a ready-to-paste summary for the group chat. The split is saved with the trip.

HOW IT WORKS

The SplitBill component recalculates when the total changes (for example when dates change or reward points are applied). Equal mode gives any rounding remainder to the first person, so the shares always add up to the exact total.

WHY IT HELPS

Groups of friends usually book on one card and then work out who owes what by hand.

Miles Morales	23604	₹23,604
Guest 2	23604	₹23,604
Guest 3	23604	₹23,604

☒ Shares add up to the total

Total ₹70,812

📄 Copy payment requests

Split between three people

2.6 Eco Score and Green Stays

WHERE TO FIND IT

Leaf badge on cards, "Stay insights" on listing pages, Green stays category, Eco Score 80+ filter, host form

WHAT IT DOES

Every stay has a 0-100 sustainability score with the reasons behind it (solar power, EV charging, natural ventilation, gardens, recycling). Stays scoring 80+ get a green badge, appear under Green stays and earn double reward points. Hosts see an estimated score while they create a listing.

HOW IT WORKS

Scores are stored per listing, and `ecoReasons()` turns the amenities into short explanations. For new host listings, the score is estimated from the amenities and categories they choose.

WHY IT HELPS

Encourages greener travel and rewards hosts who invest in sustainability.

Stay insights: Eco Score, Work-from-stay and Neighbourhood vibe

2.7 Work-from-Stay Score

WHERE TO FIND IT

Stay insights panel, Work-friendly category, Wi-Fi 100+ quick filter, minimum Wi-Fi filter

WHAT IT DOES

Combines Wi-Fi speed, whether there's a dedicated desk, the workspace amenity and how quiet the area is into one score out of 100, plus a plain-English rating such as "Smooth HD video calls".

HOW IT WORKS

workScore() uses a log scale for Wi-Fi speed (going from 10 to 100 Mbps matters more than 500 to 900) and adds points for a desk, a workspace and a calm area.

WHY IT HELPS

Remote workers can find a place that actually works for video calls.

The screenshot shows a filter panel titled "Sustainability & remote work" with a "NEW" badge. It contains two filter sections. The first section is "Minimum Eco Score: Any" with the subtext "Solar power, EV charging, gardens and more" and a horizontal slider with a red dot at the start. The second section is "Minimum Wi-Fi speed: Any" with the subtext "Measured speed reported by hosts". Below this is a row of five buttons: "Any" (selected), "25+", "50+", "100+", and "300+". At the bottom left is a "Clear all" link, and at the bottom right is a "Show 30 places" button.

New Sustainability and remote work filters

2.8 Neighbourhood Vibe Meter

WHERE TO FIND IT

Stay insights panel on every listing; also used by Smart Stay Match and Compare

WHAT IT DOES

Five bars that rate the area for nightlife, peace and quiet, families, nature and food.

HOW IT WORKS

Each listing stores five 1-5 ratings. The same numbers feed the match quiz, so choosing "Nightlife" in the quiz favours lively areas.

WHY IT HELPS

Party-goers and families want very different neighbourhoods, and listing photos don't show you the street outside.

2.9 Explore Nearby with travel times

WHERE TO FIND IT

Listing page > Where you'll be

WHAT IT DOES

A list of nearby beaches, sights and places to eat, each with its distance and an estimated walk or drive time.

HOW IT WORKS

Places under 2 km are shown as walking time and longer ones as driving time.

WHY IT HELPS

Answers "what's close by?" without leaving the listing.

2.10 Voice Search

WHERE TO FIND IT

Microphone button inside the Where field of the search bar

WHAT IT DOES

Say something like "beach stays in Goa" or "cabins in Manali". The place goes into the search box and the category is picked automatically.

HOW IT WORKS

Uses the browser's Web Speech API (SpeechRecognition, en-IN). `parseVoice()` finds words like "in/near/at" and category words such as beach, cabin, lake or eco.

WHY IT HELPS

Hands-free and more accessible, especially on mobile.

2.11 Smart Packing List

WHERE TO FIND IT

Trips page > Packing list, and the booking confirmation pop-up

WHAT IT DOES

Creates a checklist for each trip from the destination, season, trip length and amenities, for example thermals for Manali in winter, swimwear for beach stays, an umbrella during the Indian monsoon, or a laptop for work-friendly stays. Ticks are saved and a progress bar shows how much is packed.

HOW IT WORKS

packingList() combines rules about climate, category and amenities. The checked items are saved in localStorage for each booking.

WHY IT HELPS

Stops guests forgetting important items and makes the app useful after booking too.

Auto-generated packing list for a mountain trip

2.12 Add Trip to Calendar (.ics)

WHERE TO FIND IT

Trips page and booking confirmation

WHAT IT DOES

One click downloads a standard calendar file with the stay dates, location, host and confirmation code, plus a reminder the day before.

HOW IT WORKS

downloadICS() writes an iCalendar (RFC 5545) VEVENT with all-day dates, a GEO field and a VALARM reminder, and downloads it as a Blob.

WHY IT HELPS

Works with Google Calendar, Outlook and Apple Calendar.

2.13 Travel Rewards: points, tiers and badges

WHERE TO FIND IT

Profile page, checkout (Use reward points), user menu

WHAT IT DOES

Earn 1 point per INR 100 spent (2x on green stays) and 250 points for publishing a listing. Move up through four tiers (Explorer, Voyager, Nomad, Legend), unlock eight badges, and spend points at checkout (1 point = INR 1, up to 20% of the total). Cancelling a trip removes the points it earned and returns any points you spent.

HOW IT WORKS

travelStats() works out trips, nights, countries and other stats from your bookings; each badge is a small test function based on them.

WHY IT HELPS

Airbnb has no guest loyalty programme. Rewards encourage return visits and greener choices.

Points card with tier progress

Badges, unlocked as you travel

2.14 Surprise Me

WHERE TO FIND IT

Home page banner and chips, Wishlists (Pick one for me)

WHAT IT DOES

Spins the globe and suggests a random stay from your current search results or your wishlist. You can spin again or open the listing.

HOW IT WORKS

Picks a random item from the current filtered list, with a short loading animation.

WHY IT HELPS

A fun option when you can't decide.

2.15 Dark Mode

WHERE TO FIND IT

Moon icon in the header, Profile > Settings

WHAT IT DOES

A complete dark theme for every page, pop-up, calendar and map control, remembered between visits.

HOW IT WORKS

All colours are CSS custom properties; setting data-theme="dark" on the element switches the whole set at once.

WHY IT HELPS

Easier on the eyes at night. The Airbnb website only has a light theme.

Listing page in dark mode

3. Original Airbnb features recreated

These are the core Airbnb features rebuilt in this clone. Together they are the base that the new features build on.

- Header with logo, full search bar (Where / Check in / Check out / Who) that shrinks into a pill when you scroll
- Destination suggestions, search by region (including I'm flexible), a two-month date-range picker and a guest picker
- Scrollable category bar (Beachfront, Cabins, Amazing pools, Iconic cities, Treehouses...)
- Filters pop-up: type of place, price range with histogram, rooms and beds, amenities, Instant Book, Superhost, Guest favourite
- Display total before taxes switch
- Listing cards with photo carousel, wishlist heart, Guest favourite badge, rating and price
- Map view with price pins and pop-up cards (Leaflet + OpenStreetMap)
- Listing page: photo grid and photo tour, host summary, highlights, description, amenities, availability calendar, booking card with price breakdown, reviews with category ratings, map, Meet your host, Things to know
- Message host (with simulated host replies)
- Confirm and pay page with editable dates and guests and a payment method choice (demo only, no card data collected)
- Trips (upcoming / past / cancelled) with cancellation, Wishlists, and "Airbnb your home" listing creation with live preview
- Log in / sign up (demo), user menu, responsive mobile layout with bottom tab bar, recently viewed stays

4. Project structure

index.html	App shell: header, search bar, categories, footer, mobile tab bar
css/styles.css	All styling, including light and dark themes and responsive breakpoints
js/data.js	Demo listings, categories, amenities and listing builder
js/store.js	State saved in localStorage (user, wishlist, bookings, points...)
js/utlis.js	Dates, dynamic pricing, price breakdown, pop-ups, notifications
js/components.js	Listing card, date-range picker with heatmap, guest picker, compare bar
js/features.js	New features: match scoring, split bill, packing list, .ics, voice search, rewards
js/pages.js	Page views: home, listing, checkout, trips, wishlists, compare, match, host, profile
js/app.js	Search bar, filters pop-up, user menu, login, theme and hash-based page routing
docs/	This report's generator script and screenshots

5. How to run

- Open index.html in Chrome, Edge or Firefox by double-clicking it. There's no build step or server.
- Optional: run a local server with `python -m http.server 8000` and open `http://localhost:8000`.
- Photos (Unsplash), icons (Font Awesome) and maps (OpenStreetMap) need an internet connection.
- Voice search works best in Chrome or Edge. Everything you do is saved in your browser. To clear it, use Profile > Reset demo data.
